

SECTAGON®-K54

More Than Just a Soil Fumigant

Sectagon-K54 (metam potassium) may be applied by chemigation, soil injection or soil bedding equipment to suppress and/or control soil borne pests which attack ornamentals, food and fiber crops. It is sodium free and adds potassium to the soil. It is recommended for use in crops that benefit from potassium and in high sodium and high pH soils.

Why use Sectagon-K54?

- Crops, such as potatoes, benefit from the potassium
- No sodium present, benefits crops such as onion, lettuce and broccoli
- Performs better on calcium carbonate soils
- Does not add additional sodium on high sodium soils
- Performs more efficiently on high pH soils
- The elemental sulfur and potassium contained in Sectagon-K54 allow the more efficient use of Mg, Ca, K and P_2O_5 in the soil making them more available to the plant

And, an application of Sectagon-K54 gives growers not only a very effective soil fumigant, but also supplies three essential nutrients needed to achieve crop growth, quality and maximum yield potential. Each gallon of Sectagon-K54 supplies .55 pounds of nitrogen, 1.8 pounds of potassium and 2.5 pounds of sulfur. After Sectagon-K54 breaks down in the soil, these critical nutrients become available for plant development and in amounts that will influence the amount of additional N, P and K needed.

A typical application of 30 gallons of Sectagon-K54 per acre will supply 16 pounds of nitrogen, 54 pounds of potassium and 75 pounds of sulfur.

Sectagon-K54, providing an additional source of plant nutrition while giving you an effective soil fumigant.
